

MoveDatatype

The generic representation of a Move datatype (either a struct or an enum) which exposes common fields and information (module, name, abilities, type parameters etc.) that is shared across them.

Interface implemented by all GraphQL types that represent a Move datatype (either structs or enums). This interface is used to provide a way to access fields that are shared by both structs and enums, e.g., the module that the datatype belongs to, the name of the datatype, type parameters etc.
