

MoveModule

Represents a module in Move, a library that defines struct types and functions that operate on these types.

The package that this Move module was defined in

The module's (unqualified) name.

Format version of this module's bytecode.

Modules that this module considers friends (these modules can access public(friend) functions from this module).

Look-up the definition of a struct defined in this module, by its name.

Iterate through the structs defined in this module.

Look-up the definition of a enum defined in this module, by its name.

Iterate through the enums defined in this module.

Look-up the definition of a datatype (struct or enum) defined in this module, by its name.

Iterate through the datatypes (enums and structs) defined in this module.

Look-up the signature of a function defined in this module, by its name.

Iterate through the signatures of functions defined in this module.

The Base64 encoded bcs serialization of the module.

Textual representation of the module's bytecode.
