

App Examples

The ever-growing number of examples in this section showcase packages for the Sui blockchain. Extract techniques used in these examples to apply to your own Sui projects as they are written by Sui and Move experts.

Use dedicated nodes/shared services rather than public endpoints for production apps. The public endpoints maintained by Mysten Labs (`fullnode..sui.io:443`) are rate-limited, and support only 100 requests per 30 seconds. Do not use public endpoints in production applications with high traffic volume.

You can either run your own Full nodes, or outsource this to a professional infrastructure provider (preferred for apps that have high traffic). You can find a list of reliable RPC endpoint providers for Sui on the [Sui Dev Portal](#) using the Node Service tag.

Sui is dedicated to providing a wide range of examples to guide you in proper programming techniques for the Sui blockchain. This list will continue to grow, so check back often.

The projects are grouped by stack type and are sorted by complexity.
