

# SystemParameters

Details of the system that are decided during genesis.

Target duration of an epoch, in milliseconds.

The epoch at which stake subsidies start being paid out.

The minimum number of active validators that the system supports.

The maximum number of active validators that the system supports.

Minimum stake needed to become a new validator.

Validators with stake below this threshold will enter the grace period (see `validatorLowStakeGracePeriod` ), after which they are removed from the active validator set.

Validators with stake below this threshold will be removed from the active validator set at the next epoch boundary, without a grace period.

The number of epochs that a validator has to recover from having less than `validatorLowStakeThreshold` stake.
