TransactionBlockEffects

The effects representing the result of executing a transaction block.

The transaction that ran to produce these effects.

Whether the transaction executed successfully or not.

The latest version of all objects (apart from packages) that have been created or modified by this transaction, immediately following this transaction.

The reason for a transaction failure, if it did fail. If the error is a Move abort, the error message will be resolved to a human-readable form if possible, otherwise it will fall back to displaying the abort code and location.

Transactions whose outputs this transaction depends upon.

Effects to the gas object.

Shared objects that are referenced by but not changed by this transaction.

The effect this transaction had on objects on-chain.

The effect this transaction had on the balances (sum of coin values per coin type) of addresses and objects.

Events emitted by this transaction block.

Timestamp corresponding to the checkpoint this transaction was finalized in.

The epoch this transaction was finalized in.

The checkpoint this transaction was finalized in.

Base64 encoded bcs serialization of the on-chain transaction effects.
